## Labor Force Participation Rates

Source: Virginia Employment Commission - Economic Information \& Analytics Division, March 2022

The Labor Force Participation Rate is the percentage of the population that is in the labor force. The labor force is considered anyone who is employed or unemployed. Unemployed individuals are only those that are actively available and looking for work, not necessarily all individuals without a job. For the most accurate measure, the population considered is the Civilian Non-institutionalized Population. This is individuals over the age of 16, who are not in the military, and are not otherwise prevented from working, such as the incarcerated.

## Labor Force Participation Rate Changes from 2020 to 2021

(by County and Independent City)

## Frequently Asked Question

## Q: What is the Labor Force Participation Rate (LFPR)?

A: The LFPR is a labor force statistic that can be used to help analyze and asses the health of a region's economy. The statistic explains how much of the potential labor force is being realized.

## Q: How is the Labor Force Participation Rate calculated?

A: The LFPR is calculated by taking the total labor force (both employed and unemployed but actively seeking work), and dividing it by the Civilian NonInstitutional Population (CNP). The CNP includes all individuals over the age of 16 that are potentially available for work. For this reason, active duty military and residents of prisons are removed.

## Q: What is a good Labor Force Participation Rate?

A: In recent decades the LFPR has reached its peak, but usually averages in the mid to upper 60s. The Virginia participation rate is currently at $63.0 \%$, while the national rate is $62.3 \%$. The national rate reached its peak of $67 \%$ in 2001, with a sharp decline since the end of the last recession. Virginia's rate saw a steep decline due to the COVID-19 pandemic, and has not recovered to pre-pandemic levels. For more information regarding state averages for all 50 states as well as the national participation rate, see the U.S. Bureau of Labor Force Statistics at www.bls.gov."

Q: Why is the Labor Force Participation Rate so low, even though the unemployment continues to decline?
A: Consider the populations that this statistic draws from. Due to data availability at the sub-state level, some segments of the population that are not likely to participate in the labor force are left in the CNP equation. For example, the retired population, as well as the sick and disabled, remain part of the CNP. For these reasons, the population of potential labor force participants remains large. Contrastingly, the unemployment rate utilizes only those in the labor force, necessarily lowering the percentage, and creating more potential for fluctuation.

Q: Why is my county's participation rate lower than another county, even though my region has higher employment?
A: The largest factor in determining participation rates is the size of the denominator (population). Consider the following example. Region A has a civilian non-institutional population of 251,434 and its labor force is 180,031 ; Region $B$ has a CNP of 252,172 with a labor force of 179.138. Because both regions have nearly identical CNPs and labor force sizes, the difference in their employment figures becomes arbitrary in participation rate calculations.

[^0]:    - The labor force participation rate is the percentage of the population that is either employed or unemployed (that is, either working or actively seeking work)
    - The labor force is made up of the employed and the unemployed.
    - People with jobs are employed.
    - People who are neither employed nor unemployed are not in the labor force.
    - People who are jobless, looking for a job, and available for work are unemployed.
    - See https://www.bls.gov/cps/cps_htgm.htm and https://www.bls.gov/cps/eetech_intro.pdf for more detailed technical information
